Major mental disorders impose a great burden on society. Preventing these disorders would provide immense benefit in terms of both money and human suffering. The 2005 meeting will address a number of key issues for making progress in preventing major mental disorders, ranging from the level of the DNA molecule to the level of governmental policy. Presentations will address how prevention efforts should be informed by an understanding of etiology and knowledge of indicators of vulnerability. Approaches to prevention at the level of public policy will be considered through presentations by representatives of the National Institutes of Health. Examples from areas of psychopathology that have already been the focus of considerable attention, such as schizophrenia, Alzheimer's disease, substance abuse, antisocial personality disorder and PTSD, will be used to exemplify approaches to prevention.
